

Adjusting rocker bars 60 mm

Product description:

The adjusting rocker bar is a metal construction element which is produced by compression molding from rolled metal zinc sheet with thickness of 0.80 mm or 1.00 mm. The hanger is produced with circle and oval openings which are used for anchoring into the building construction and mounting the metal profiles using self-drilling screws. Main difference in comparison with profile bracket is pressed bend which gives the hanger acoustic properties and higher loading.

Range of usage:

The product is used for metal profiles mounting into vertical, horizontal or sloping construction of the buildings. Používají se především v místnostech, kde je předepsaná vyšší požární odolnost či zatížení.

Characteristics:

Material	Rolled sheet DX51
Coating	Zinc – min Z100 (ČSN EN 10327)
Thickness	0.80 mm / 1.00 mm (ČSN EN 10143)
Reaction to fire	Class A1 (EN 14195)
Durability	Class B
Hazardous substance	NPD

Product variability:

Real weight may vary in range of +/-5% according to ČSN EN10143

Mounting:

Mount the rocker bar into the solid structure with self-tapping screws or ceiling anchor. Bend the sides of the bracket by 90° so only a middle part would stay anchored. Insert the 60 mm profile between the bended sides and secure it into the position with self-drilling screws.

Packaging:

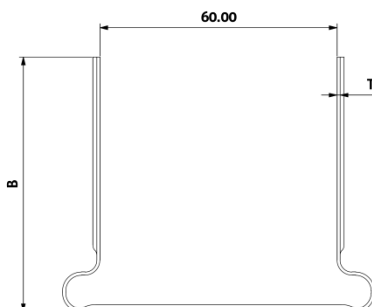

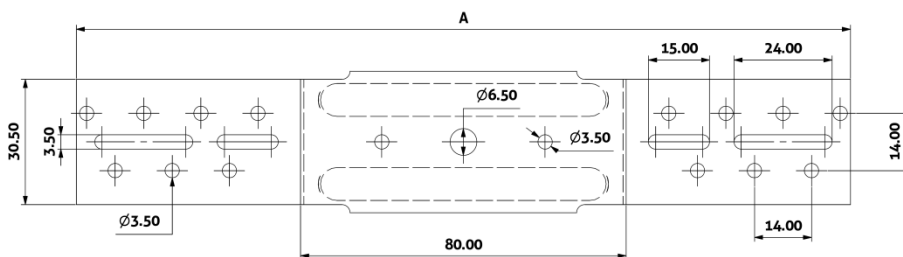

The brackets up to length of 150 mm are packed by 100 pcs in carton box. Longer variations are packed by 25 pcs with stretch foil. Every dimension is labeled with identification tag.

Blister packing of rocker bars 65 and 95 mm consists of 15 pcs in transparent plastic casing covered by cardboard plate with a description of the product.

Recommended storage:

The product is required to store in dry and temperate environment in order to prevent condensation on the surface of the product and damage to the packaging.
